Hi Karl,

In our group of Budwig protocol users there is a man who had pancreatic cancer. He was operated on in 2003 but had a huge setback with tumor recurrence 9 months after the operation. He was a very ill man with nephritis in his kidney and severe ascites when he first contacted me in March 2004. After five months on the Budwig protocol the tumor disappeared and the ascites as well as the kidney nephritis were all cleared up. I will copy and paste his medical report here for you to see. He has now been on the Budwig protocol for 18 months and is in perfect health.

I think the most important thing is to start very slowly and build up slowly to six tablespoons of oil mixed with 12 tablespoons of [cottage cheese]. Also very important for this man was that he couldn't eat cooked foods at all, mostly juiced veggies and papaya and pineapple for the digestive enzymes with every meal.

Lots of strongs  
Cheryl

#### CT ABDOMEN AND PELVIS.

Technique,

Contrasted spiral axial CT scans in an arterial and portal venous phase done through the liver, abdomen and pelvis with a collimation of 8mm, pitch of 1.5 and 7mm, reconstructions. 150ml, Ultravist 300 injected 1V1.

#### FINDINGS

The patient had a previous right nephrectomy.

The post-op changes in the region of the right bed within limits

The patient also had a partial pancreatectomy with excision of the pancreas head and with a Whipples by-pass procedure.

The post-op changes appear within limits and no obvious recurrence of the tumor demonstrated.

There is slight prominence of the intra-hepatic biliary duct with pneumatobilia.

No focal liver lesions seen.

No splenomegaly noted

Due to the pancreatectomy extensive collateral varicose veins present in the abdomen (cavernous transformation)

The aorta, IVC and para-aortic areas are normal and no retroperitoneal lymphadenopathy noted.

There is compensatory hypertrophy of the left kidney.

No focal left renal lesions seen.

No hydronephrosis noted.

The bowel has a normal configuration and no intra-abdominal masses or ascites seen.

The bladder is normal.

The bony elements and abdominal wall appear intact.

#### CONCLUSION.

Follow-up post right nephrectomy and partial pancreatectomy with a Whipples procedure.

Normal post surgical changes present and no signs of tumour recurrence demonstrated.

#### PART I - Breast Cancer (for Pancreatic Cancer see PART II below)

-----

Hello Elena,

I feel real good about my case and will very soon have tests done that should give a definitive answer to how I am doing. I was diagnosed on Oct. 8, 2002 with a large breast cancer - "lobular infiltrating carcinoma".

I began that same day on FO/CC. My cancer was very painful at first - in fact that is when I discovered it, was when the pain awakened me at 5:00 a.m. I started that same day eating FO/CC (FlaxOil/ low fat cottage cheese).

By the middle of November my pain was all gone and I have remained painfree. The tumor has shrunk dramatically, and my doctor was even amazed. On October 14, I will have a C.A.T. scan. I have already had a P.E.T. scan. The results of both of these scans will tell me the whole story. With the P.E.T. scan, they injected into my veins sugar and radio-active-isotopes. The sugar goes to all spots in my body where there is any cancer, and will even show how large it is. And it can be tracked by the radio active isotopes. I can still feel a small ridge and I have wondered if that is scar tissue (since it has been so long since I have felt any pain). Well, now when I get these results, I will know if it is still cancer or just scar tissue. I will post to this group whatever my results are.

#### PART II - Pancreatic Cancer

-----

I had no doubts about beginning on the FL/CC regimen, as my husband had a very large, and metastasized pancreatic cancer, in 1994. He took many things in the alternative field, but NOTHING IN the medical field, (unless you want to consider his 3 weeks of IV treatments of Laetrile) He also took FO/CC 3 times a day.

To his surgeon's astonishment, he was well in 5 months after surgery. The surgeon had told us that he would die and that he might live 3 to 6 months - 3 being most likely.

He had gotten ill at the end of December, 1993 and was in and out of the hospital until May 25, he had exploratory surgery and got the grim reports I reports above. But after we got home and got him on the juicing, he just began getting better. I was making fresh vegetable juice and giving him 12 ounces about every 2 hours. And we followed the diet scrupulously - no meat, absolutely no pork, no sugar, no processed foods of any kind, etc. etc. and he just kept getting better.

Finally in November 1994, I wrote to the surgeon and ask him if he would schedule a CT scan for when we had an appointment on December 5, 1994. He did that and when he came to give us the report, he was just shaking his head. He said "I don't know what to tell you folks, but there is no cancer in there. I even had the radiologist come back and study that with me and we can see nothing abnormal in there of any kind."

So with that kind of encouragement, I felt confident to do basically the same thing. Except that in the meantime, I have learned a lot more about FC/CC and so I am going mostly all the way with that.

I guess you could say I have put all my eggs in that one basket. I know this is a long message and I am sorry. I hope it helps your mother. My husband was 54 the year he got sick. He is still well and still with me today.

Hope this helps, Nan

"Mum was diagnosed with gastric cancer in Jan 2011 which has metastasised to pancreas (had surgery but inoperable so had gastric bypass instead) and last September (after 6 cycles of EOX chemo) to the lungs.

Mum has been on Budwig Diet for nearly 4 months (since October 2011) and overall she is doing great. Her tumour stopped bleeding so she no longer is dependant on blood transfusions, her haemoglobin is rising naturally (10.8 last December, previously it has been as low as 3.5), her liver function is within normal range (Alkaline Phosphatase 93 rather than the previous ~270), she is almost off all medication given by oncologist (still takes 1 esomeprazole - reduces acid production and 1 tranexamic acid - 'thickens' the blood, daily), she put on 15kg in 2 months and her weight has stabilised now for the past 2 months, she is increasingly active and from being in a vegetative state for 9 months she has started to lead a normal active life..."

On Dec. 4, 2009, in our forum, Mary wrote:

Greetings everyone,

This is my first post to the group and I am happy to share some good news with you all. My stepdad was diagnosed with Stage IV Pancreatic and Liver Cancer on August 15th. As soon as it was suspected that he may be diagnosed with cancer we started him on the Budwig Protocol. At that time, his tumor markers were at 1500 and he was given a couple of weeks to live.

He initially decided to go with a highly aggressive chemotherapy treatment and after the first treatment, the side effects were so severe that he did not go back. Instead, he went to another doctor who put him on a low dose of Gemzar to "buy him a few more weeks". The mainstay of his plan has been "a light dose" of Gemzar and the BP. We've played a little with alkaline foods, and almond seeds but found a lot of conflicting information. So the main focus for him has been the Gemzar and the BP.

Since September he's been following this plan. He has an excellent appetite, has been gaining weight, the pain has subsided, and he is now back to his normal daily activities. Yesterday he received the results of his tumor markers and they fell to 200. The doctor said "the cancer is dying." (yay!)

As a side note, a friend of the family also asked for the BP because her daughter-in-law was diagnosed with breast cancer the same week as my step dad. Five weeks after being on the BP, she was told they couldn't find the tumor, anymore.

Stay hopeful, the BP does work!!
